

Basic Vermicomposting

Vermicomposting is a process that relies on worms to convert organic matter (food wastes) into compost

Food scraps, yard clippings and other organic materials make up 40% of the waste stream.

Vermicomposting reduces this waste and turns it back into valuable soil nutrients to produce healthier plants.

Sponsors:

**THURSDAY
MARCH 23, 2017**

5:30 PM- 7:00 PM

**OSU SOUTH CENTERS
